2. Suppose $m \in \mathbb{Z}$. If $m \mod 8 = 7$, what is $5m \mod 8$?

3. Today is Tuesday, October 30, 2012, and this year was a leap year. While you don't know where you will be on October 30, 2022, what day of the week will it be? Justify your answer using the quotient-remainder theorem.

4. For the following statement: \forall real number x, if -1 < x < 0 then x + 1 > 0. Write the negation of this statement.

$$\exists x \in \mathbb{R} \mid -1 < x < 0 \text{ and } x + 1 \leq 0$$

- 5. Use the definitions and properties of even and odd integers to determine whether the following statements are true or false:
 - a. If m and n are integers, $6m^2 + 34n 18$ is an even integer.

$$6m^2 + 34n - 18 = 2(3m^3 + 17n - 9)$$
 Factoring

Let $k = 3m^2 + 17n - 9$.

 $k \in \mathbb{Z}$ properties of integers

 $6m^2 + 34n - 18 = 2k$ Substitution

 $2k$ is even Def. of even

 $6m^2 + 34n - 18$ is even. Transitivity.

b. For all integers a, b, and c, if a|b and a|c then a|(2b-3c).

$$(a \mid b) \Rightarrow b = a \times, x \in \mathbb{Z}$$
 Def. of divisibility.
 $(a \mid c) \Rightarrow c = a y, y \in \mathbb{Z}$

$$2b - 3c = 2(ax) - 3(ay)$$

$$= a(2x - 3y)$$

$$a \mid (a(2x - 3y))$$

$$\therefore a \mid (2b - 3c)$$

$$\therefore a \mid (2b - 3c)$$

c. The sum of any three consecutive even integers is divisible by 6.

Let
$$a \in \mathbb{Z}$$
.

2a is even.

Def of even.

Adding 2 will produce the next even in teger.

 $2a + (2a+2) + (2a+2+2) = 6a + 6$
 $= 6(a+1)$
 $6|(6(a+1))$

... 6 divides any three consecutive even integers.

- 6. Determine whether the statement is true or false, justifying your answer with a proof or counterexample as appropriate:
 - a. Every positive integer can be expressed as a sum of three or fewer perfect squares.

The theorem is false. I can not be written as the sum of three or fewer perfect squaret.

b. For all integers n, $n^2 - n + 11$ is a prime number.

Let
$$n = 11$$
.

$$(11)^{2} - 11 + 11 = 11^{2} = 121$$

$$11 | 121$$

$$121 \text{ is composite}$$

:. The theorem is false.

7. Is the following argument valid or invalid? Justify your answer.

All real numbers have nonnegative squares.

The number i has a negative square.

Therefore, the number i is not a real number.

R: a number is real

S: a number has a nonnegative square

R -> S

(2) NS

modus tollens .: ~ R

Valid.

- 8. Reorder the premises and state the conclusion that follows logically from the argument. (It may be helpful to rewrite some of the statements in if-then form and replace some statements with their contrapositives.
 - 1. Animals, that do not kick, are always unexcitable
 - 2. Donkeys have no horns
 - 3. A buffalo can always toss one over a gate
 - 4. No animals that kick are easy to domesticate.
 - 5. No hornless animal can toss one over a gate
 - 6. All animals are excitable, except buffalo
 - (2) Donkeys have no hoins.
 - (5) No hornless animal can toss one over a gate.
 - (3) A buffalo ean always toss one over a gate.

Note: This means a boffalo has hoins - buffalos & donkeys.

(6) All animals are excitable, except but falo.

Note: This means donkeys are excitable.

- (1) Animals that don't Kick are always unexcitable. Note: ~K > ~ E contrapositive E > K therefore donkeys kick.
- (4) No animals that Kick are easy to domesticate.

:. Donkeys are not easy to domesticate.

9. A Suncoast student has to make some decisions when entering this school: their magnet program (CS, MSE, IB, or IIT), their foreign language (Spanish or French), an elective credit (fine arts or business/vocational), and how they will be satisfying their Physical education requirement (taking the class here, taking it online through FLVS, or participating in a varsity sport). Four students enter Suncoast and make the following selections:

Kayla: IB, French, chorus, varsity volleyball
Ming: MSE, French, PE on FLVS
Herbert: CS, Spanish, computer programming, PE on FLVS
Alex: IIT, Spanish, drafting, PE with Ms. McCann at Suncoast
Adit: MSE/IB, Spanish, French, programming, PE on FLVS

Write each of the following statements informally and find its truth value. If no truth value exists, answer accordingly.

a. \exists a decision D such that \forall students S, S chose D.

Every student chose the same option for one of the four decisions.

This is false.

b. \exists a student S such that \forall decisions D, S chose D.

There is a student that chose every Single thing there is to choose.

This is false.

c. \exists a student S such that \forall categories C, \exists a decision D in C such that S chose D.

There is a student that made a decision in each category.

This is true. Kayla made a decision for each category.

d. \forall students S and \forall categories C, \exists a decision D in C such that S chose D.

Every option from every category was chosen by at least one student.

This is false. Adit chose MSE/IB, which is not a decision from any category.

ANSWERS:

- 1. a. 37 b. 1
- 2. 3
- 3. Sunday
- 4. $\exists a \ real \ number \ x \ such \ that -1 < x < 0 \ and \ x+1 \le 0$
- 5. a. $6m^2 + 34n 18$; $2(3m^2 + 17n 9)$ (factoring); $k = 3m^2 + 17n 9, k \in$ \mathbb{Z} (properties of integers); $6m^2 + 34n - 18 =$ 2k (substitution); 2k is even (definition of even); therefore $6m^2 +$ 34n - 18 is even integer (transitivity)
 - $b. (a|b) \rightarrow b = ax$ $x \in \mathbb{Z}$ (definition of divisibility); $(a|c) \rightarrow c = ay$, $y \in \mathbb{Z}$ (definition of divisibility); 2b = 2ax (substitution); 3c= 3ay (substitution); 2b - 3c
 - $=2ax-3ay \ (substitution); \ \left(a\big|a(2x-3y)\right); \ \left(a\big|(2b-3c)\right)$ c. let $a,b,c \in \mathbb{Z}$ (definition of divisibility); a=2k,b=2k+2,c=2k+4,k $\in \mathbb{Z}$ (definition of even and consecutive; a+b+c=6q+0,q $\in \mathbb{Z}$; 2k + 2k + 2 + 2k + 4 = 6q + 0; 6k + 6 = 6q; 6(k + 1)
- = 6q; 6k + 6 is divisible by 6; therefore a + b + c is divisible by 66. a. False (counterexample, x = 7); b. False (counterexample, n = 11)
- 7. Valid modus tollens
- 8. 2, 5, 3, 6, 1, 4 Donkeys are not easy to domesticate
- 9. a. False; b. False; c. True; d. False
